DATA LAB
Lab Debrief

As a class, spend some time discussing the following questions. It's also possible to use a strategy such as think-pair-share with these questions.

1. Data science is a field that utilizes programming to bring together data engineering, mathematics, and statistics.

  a. How does this lab, and computer science in general, relate to data science?

  b. What are some other uses of data science that have impacted your everyday life?

  c. What are some specific challenges that you imagine data scientists encounter?

2. Data structures such as arrays and `ArrayLists` are used to organize data and simplify data processing.

  a. Discuss one data structure that you used in the completion of this lab. How did it help in the processing of data?

  b. Would you have been able to complete this lab without the use of a data structure? Why or why not?
